A double-layered surgical glove prevents needle-stick injuries, which are widespread from sharp equipment like needles, scissors, hooks, scalpels, and various bladed instruments. Wearing double-layered surgical gloves provides double protection; even if the outer layer is damaged, blood or fluids will not pass through the inner layer. The inner glove is usually thinner and fits the hand well, providing a comfortable fit and good operating dexterity. Its material is generally softer to reduce the restraint on the hand while ensuring good touch. The outer glove is relatively thicker and has stronger protective properties. It can withstand greater pressure and friction, prevent sharp penetration and chemical erosion. The surface of the outer glove is usually specially treated, such as anti-slip and antibacterial, to improve the safety and efficiency of surgical operations.
