According to our (Global Info Research) latest study, the global Double-wire Cutting Balloon market size was valued at US\$ 504 million in 2024 and is forecast to a readjusted size of USD 669 million by 2031 with a CAGR of 4.2% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The double-guidewire cutting balloon is a special interventional medical device. The double-guidewire cutting balloon usually consists of a guidewire fixed on the outside of the balloon and a short guidewire passing through a cavity at the distal end of the balloon. This design allows the balloon to generate a higher longitudinal cutting force at a lower pressure. At the same time, the double-guidewire structure can effectively prevent the balloon from slipping during the expansion process, thereby enhancing its stability. When the double-guidewire cutting balloon is delivered to the vascular lesion, it is expanded by applying pressure to the balloon. During the expansion process, the two guidewires on the surface of the balloon will have a cutting effect on the vascular wall, cutting the hardened plaque or hyperplastic intimal tissue regularly. This cutting effect avoids the expansion of the blood vessel by the disordered force of the ordinary balloon, thereby reducing the damage of the balloon to the blood vessel. The double-guidewire cutting balloon is mainly used to treat vascular lesions with higher hardness that are difficult to expand. For example, in stenotic lesions in coronary arteries or lower limb arteries, when ordinary balloons are difficult to expand, the double-guidewire cutting balloon can be considered for pretreatment. In addition, double-guidewire cutting balloons are also commonly used to prepare the arterial lumen before drug-coated

balloons to obtain a larger lumen area and increase the absorption and penetration of drugs on the surface of drug-coated balloons.
