A drainage-type endobronchial blocker is a specially designed medical device that can be inserted into the bronchus to block the ventilation of a specific lobe or segment of the lung and has a drainage function. This device is usually inserted through a bronchoscope or fiber bronchoscope to ensure accurate placement. A drainage-type endobronchial blocker usually consists of a catheter for guiding the blocker into the bronchus, an inflatable balloon part for tightly fitting the bronchial wall to achieve the blocking function, an inflation connector for connecting an inflation device to inflate or deflate the balloon, and a drainage channel designed to drain liquid or gas in the bronchus.
