The droplet-generating glass chip is a microfluidic device based on glass materials, which is specially used to generate and manipulate droplets. Due to the excellent chemical stability, transparency and biocompatibility of glass, this type of chip is widely used in biomedicine, chemical synthesis and material research. The droplet-generating glass chip realizes precise manipulation of liquids through microchannel structures, generating microdroplets of uniform size and controllable composition, which are often used in single-cell experiments, drug development and micro-reaction analysis. Its high transparency helps to monitor the reaction process in real time and improve the visualization and accuracy of the experiment.
