Drug microneedle patches are an innovative drug delivery system that uses tiny, needle-like projections to administer medications through the skin. These patches are similar in design to vaccine microneedle patches but are used for delivering various drugs. The microneedles can be designed to either dissolve after penetrating the skin, releasing the drug, or they can be coated with the drug, which then diffuses into the skin as the microneedles remain in place. Drugs delivered through the skin can bypass the digestive system, avoiding issues like drug degradation in the stomach or liver and allowing for better absorption.
