Abstracts

According to our (Global Info Research) latest study, the global Dust Particle Centrifugal Separation Technology market size was valued at US\$ 629 million in 2024 and is forecast to a readjusted size of USD 821 million by 2031 with a CAGR of 4.1% during review period.

Dust particle centrifugal separation technology refers to the process of using a high-speed centrifuge to spin the dust particles in the dust-laden gas under strong centrifugal force, so that they are thrown toward the side wall of the equipment or a specific collection device, achieving effective separation of dust particles from the gas. This process mainly relies on the difference in density between the dust particles and the surrounding gas, accelerating sedimentation in the centrifugal field to achieve the purpose of separation. Dust particle centrifugal separation technology is a separation technology based on the principle of inertial centrifugal force and material density difference.
