According to our (Global Info Research) latest study, the global EB Virus Nucleic Acid PCR Detection Kits market size was valued at US\$ 189 million in 2024 and is forecast to a readjusted size of USD 341 million by 2031 with a CAGR of 8.9% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Epstein-Barr virus (EBV), also known as human herpes virus, is very common in the population, and more than 90% of adults have positive serum EBV antibodies. EBV is mainly transmitted through saliva and can also be transmitted through blood transfusion. Foreign data show that most children under 6 years old show asymptomatic infection or only non-specific manifestations such as upper respiratory tract symptoms, but about 50% of adolescents show infectious mononucleosis (IM). In addition to primary EBV infection that can cause infectious mononucleosis (IM), EBV also causes non-tumorous severe EBV-related diseases such as chronic active EBV infection (CAEBV) and EBV-related hemophagocytic lymphohistiocytosis (EBV-HLH). EBV is also a tumorigenic virus and is associated with the occurrence of many tumors, such as Hodgkin's lymphoma (HL), non-Hodgkin's lymphoma (NHL), nasopharyngeal carcinoma (NPC), gastric cancer and post-transplant lymphoproliferative disorder (PTLD).
