Abstracts

According to our latest research, the global ECM-derived Biomaterials market size will reach USD 67.3 million in 2031, growing at a CAGR of 7.5% over the analysis period.

Extracellular matrix (ECM)-derived biomaterials are biological scaffolds created from the ECM of tissues, providing structural and biochemical support for cells. The ECM is a complex network composed of proteins, glycoproteins, and other molecules that form a supportive environment for cell attachment, growth, and differentiation. ECM-derived biomaterials are produced by decellularizing tissues to remove cellular components while preserving the ECM structure. These biomaterials are used in tissue engineering and regenerative medicine because they mimic the natural environment of tissues, promoting tissue repair and regeneration. They have been applied in a variety of medical fields, including wound healing, organ repair, and reconstructive surgery, due to their ability to support cell proliferation and integration into host tissues?.
