## Abstracts

According to our (Global Info Research) latest study, the global Electric Weeding Machine market size was valued at US\$ 77.17 million in 2025 and is forecast to a readjusted size of US\$ 122 million by 2032 with a CAGR of 6.8% during review period.

Electric weeding machine is a type of non-chemical weeding device powered by electricity. They use electricity to heat plant cells, instantly destroying the cellular structure of weed tissue, causing it to dehydrate, wilt, or die, thus achieving the purpose of physical weed control. Demand primarily stems from the rigid requirements of global agricultural sustainability and organic farming standards for 'non-chemical weed control,' aiming to address issues such as herbicide resistance, soil pollution, and food residues caused by chemical herbicides. Its upstream supply chain includes high-voltage generator manufacturers (core energy modules), machine vision and sensor suppliers (weed recognition systems), robot chassis and actuator suppliers (automation carriers), and control system integrators. Downstream, it directly serves large-scale organic farms, meticulously managed vineyards and orchards, municipal landscaping management units, and agricultural robotics service companies, serving as a key tool in promoting precision agriculture and green production from concept to practice. In 2025, the production of electric weeding machine is estimated at approximately 500 units, with an average selling price of approximately US\$150,000 per unit, a gross profit margin of approximately 35%, and a single-line production capacity of approximately 40 units per year.
