Abstracts

According to our (Global Info Research) latest study, the global Electrified Gasoline(E-gasoline) market size was valued at US\$ 84.63 million in 2025 and is forecast to a readjusted size of US\$ 260 million by 2032 with a CAGR of 17.6% during review period.

Electrified gasoline(E-gasoline) is a synthetic liquid fuel produced through an electro-liquid conversion technology, with the same chemical composition as traditional fossil gasoline. Its production utilizes entirely renewable energy and achieves carbon neutrality throughout its entire lifecycle. Upstream, it involves renewable energy power supply, water electrolysis to produce green hydrogen, and carbon dioxide capture facilities; midstream, it comprises synthesis and refining plants that synthesize liquid hydrocarbon fuel from green hydrogen and carbon dioxide through catalytic reactions. Downstream demand primarily comes from sectors with 'difficult emission reduction': existing internal combustion engine vehicles, high-performance racing cars, and special machinery that are constrained by carbon neutrality policies but difficult to electrify. The entire industry chain is driven by carbon neutrality regulations, declining technology costs, and the strategic need to preserve and reuse existing energy infrastructure assets. In 2024, electrified gasoline production was estimated at 5,000-15,000 tons, with an average selling price of approximately US\$3,000-10,000 per ton, a gross profit margin of approximately 30%, and a single-line capacity of 500-2,000 tons per year.
