Abstracts

According to our (Global Info Research) latest study, the global Electronic-Grade Isopropyl Alcohol (IPA) market size was valued at US\$ 68.07 million in 2025 and is forecast to a readjusted size of US\$ 98 million by 2032 with a CAGR of 5.2% during review period.

Electronic-Grade Isopropyl Alcohol (IPA) is an ultra-high purity solvent used primarily in semiconductor and advanced electronics manufacturing for critical cleaning, surface preparation, and wafer/substrate drying, where trace metals, anions, particles, moisture, and organics must be tightly controlled to prevent defects. In 2025, the average global price is approximately US\$9.0 per kg, with global sales volume around 7,350 metric tons and production volume about 7,700 metric tons; the industry typically maintains a gross margin of 22%–35%, driven by multi-stage purification and contamination control, clean packaging/handling, stringent QA (ppt–ppb level impurities), and customer qualification requirements. The supply chain includes upstream propylene/IPA base production, purification media and process utilities, ultra-clean packaging (drums/IBCs/tankers) and filtration, plus logistics under contamination risk control; midstream manufacturers perform deep purification, online/lot metrology, cleanroom filling, and spec certification (often aligned with semiconductor standards); downstream customers include fabs and display manufacturers, wet-bench and IPA vapor-drying process owners, and electronic chemical distributors/integrators supplying front-end processes.

According to industry analysis, electronic-grade IPA demand is increasingly shaped by advanced-node contamination budgets: as fabs push smaller geometries, the tolerance for trace organics and ionic/metal impurities tightens, making purification capability,

metrology (ppt–ppb control), and contamination-safe logistics as important as base IPA capacity; recent investments and expansions highlight the strategic nature of ultra-high purity IPA supply for domestic fab build-outs.
