## Abstracts

Ammonium Nitrate is a chemical compound with the formula  $\text{NH}_4\text{NO}_3$ . It is composed of nitric acid and salt of ammonia. In room temperature, ammonium nitrate appears in a white crystalline form and it is also colorless. These crystals are rhombohedra in shape but when they are subjected to temperatures above 32 degrees Celsius, they change to monoclinic crystals.

It is predominantly used in agriculture as a high-nitrogen fertilizer. The compound is used as explosives in mining, and also sometimes in improvised explosive devices. It is the main component of ANFO, a popular explosive, which accounts for 80% explosives used in North America. It is used in instant cold packs, as hydrating the salt is an endothermic process.

Because of the safety consideration, currently many countries put a limit on the import of Ammonium Nitrate, factories normally need a license to produce AN.
