Abstracts

Kojic acid with the chemical name 5-hydroxy-2-hydroxymethyl-4-pyrone is produced by several species of fungi, especially *Aspergillus oryzae*, which has the Japanese common name koji. It is a by-product in the fermentation process of malting rice, for use in the manufacturing of sake, the Japanese rice wine. ¹³C-Labeling studies have revealed at least two pathways to kojic acid. In the usual route, dehydratase enzymes convert glucose to kojic acid. Pentoses are also viable precursors in which case dihydroxyacetone is invoked as an intermediate.
