An EMS video laryngoscope is a medical device used by emergency responders to facilitate intubation, which is the process of inserting a tube into a patient's airway to ensure proper ventilation and oxygenation. Unlike traditional laryngoscopes, which use a direct line of sight to visualize the vocal cords, video laryngoscopes are equipped with a camera and a display screen that provide a real-time video feed of the airway. This technology enhances the ability to visualize the anatomy of the airway, making it easier to identify the vocal cords and perform intubation, especially in difficult or challenging airway situations. Video laryngoscopes can improve the success rate of intubation, reduce the risk of complications, and provide a better view for both the operator and any assisting personnel. They are increasingly used in pre-hospital settings by paramedics and other emergency medical providers.
