## Abstracts

According to our latest research, the global Enterprise Decentralized Digital Identity Management market size will reach USD 334 million in 2031, growing at a CAGR of 31.3% over the analysis period.

Enterprise Decentralized Digital Identity Management (EDDIM) is an approach that involves managing digital identities using decentralized technologies, such as blockchain. This method allows for enhanced security, privacy, and control over identity data, providing significant benefits for organizations. Decentralized digital identity management systems use blockchain and similar technologies to enable a user-centric approach to identity verification. Instead of relying on a central authority to verify and manage identities, this system allows individuals to control their own identity data. This method is often built upon distributed ledger technology (DLT), which ensures the security and integrity of data without the need for a central control point.
