Abstracts

DNA sequencing refers to the methods and technologies that used to determine the orders of nucleotide bases in a DNA molecule, namely adenine (A), guanine (G), cytosine (C) and thymine (T). DNA sequencing enables us to perform a thorough analysis of DNA because it provides us with the most basic information of all: the sequence of nucleotides. The knowledge of DNA sequences has formed the basis of basic biological researches and clinical genetic diagnosis. There are also numerous applied technology fields such as biotechnology, forensic science and biological systematics that are heavily dependent on the information generated through DNA sequencing.
