A flow diverter system is a medical device used primarily in the treatment of intracranial aneurysms. It consists of a stent-like structure that is placed within a blood vessel to divert blood flow away from an aneurysm, promoting its gradual occlusion and reducing the risk of rupture. The device alters the hemodynamics, encouraging the natural formation of a clot within the aneurysm sac.

The flow diverter system market is growing due to the increasing incidence of intracranial aneurysms and advancements in medical imaging and interventional technologies. The demand for minimally invasive treatment options is driving the adoption of flow diverter systems, which offer an effective alternative to traditional surgical approaches.
