Fluorescence biosensor is a kind of biosensor based on fluorescent protein, which is used for highly sensitive and quantitative visual research of biochemical processes in cells and organisms. Fluorescent biosensors play an important role in research and applications. They can continuously monitor various biochemical activities in living cells, reveal cell-to-cell heterogeneity, and help understand the complex regulatory relationships between cell signaling, metabolism, and other biochemical activities. However, due to limitations in the emission spectral width and available spectral space of fluorescent proteins, only a few biosensors can currently be imaged?.
