## Abstracts

According to our (Global Info Research) latest study, the global fNIRS System market size was valued at US\$ 189 million in 2024 and is forecast to a readjusted size of USD 389 million by 2031 with a CAGR of 10.9% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

A functional Near-Infrared Spectroscopy (fNIRS) system is a non-invasive optical imaging technology used to monitor brain activity by measuring changes in blood oxygenation and blood flow in the cerebral cortex. The system uses near-infrared light, which penetrates the skull and is absorbed by hemoglobin in the blood, allowing it to detect differences in oxygenated and deoxygenated blood. fNIRS systems consist of sources and detectors placed on the scalp, which emit and capture the reflected light, respectively, to produce a map of neural activity. This method is highly valued for its portability, ease of use, and ability to measure brain activity in natural settings, making it suitable for a wide range of applications in cognitive neuroscience, psychology, education, and clinical research. It is particularly advantageous for studying populations that may be difficult to assess with traditional imaging methods, such as infants or individuals with limited mobility??.
