A full scleral lens is a type of rigid gas-permeable contact lens that is designed to cover the entire cornea and extend to the sclera area. It rests on the sclera and does not come into direct contact with the cornea. Instead, a layer of preservative-free saline solution fills the space between the lens and the cornea, forming a regular optical interface. This helps correct irregular astigmatism of the cornea and improve visual quality. It has the advantages of good comfort, high oxygen permeability, and the ability to protect the eye surface. It is mainly used for the correction of various refractive errors, such as high myopia, high hyperopia, and astigmatism, as well as for the treatment and correction of eye conditions like keratoconus, corneal trauma, and severe dry eye syndrome.
