## Abstracts

According to our (Global Info Research) latest study, the global Fused Corundum Bricks market size was valued at US\$ 720 million in 2025 and is forecast to a readjusted size of US\$ 1002 million by 2032 with a CAGR of 4.9% during review period.

Fused corundum bricks are high-performance refractory products made primarily from industrial alumina or high-quality bauxite. The molten material is completely melted in an electric arc furnace at high temperatures (typically >2000?), then poured into molds of a specific shape, followed by cooling, crystallization, annealing, and machining. The core demand stems from the extreme requirements of modern high-temperature industries (such as glass, petrochemicals, steel, and ceramics) for ultra-long lifespan and stable production of key components in kilns under extreme temperatures, chemical corrosion, and mechanical erosion. The upstream supply chain begins with raw materials such as high-purity industrial alumina and zircon sand, as well as specialized equipment such as large electric arc furnaces required for production. Downstream, it is directly used in the construction and maintenance of major industrial kilns such as glass melting furnaces, petrochemical gasification furnaces, steel refining units, and ceramics. Its performance directly determines the continuity and economy of high-end manufacturing processes. In 2025, the production of fused corundum bricks is estimated at approximately 200,000 tons, with an average selling price of approximately US\$3,500 per ton, a gross profit margin of approximately 30%, and a single-line capacity of approximately 6,000 tons per year.
