Abstracts

According to our latest research, the global Gas Carburizing Service market size will reach USD million in 2031, growing at a CAGR of %over the analysis period.

Gas carburizing service is a carburizing process carried out in a gaseous active medium in a carburizing atmosphere and is widely used in the field of metallurgy. The main advantage of this process is the ability to precisely control the carburizing process and improve the quality and performance of the workpiece. The main process parameters involved in gas carburizing include carburizing temperature, holding time, number of furnace gas changes, and carbon potential selection and control. The carburizing temperature is usually between 880°C and 930°C, while the holding time depends on the required carburizing layer thickness and temperature. The number of furnace gas changes and the control of carbon potential are crucial to maintaining the activity of the carburizing process and preventing air from outside the furnace from entering.
