## Abstracts

According to our (Global Info Research) latest study, the global Gene Sequencing for Basic Research market size was valued at US\$ 12540 million in 2024 and is forecast to a readjusted size of USD 35800 million by 2031 with a CAGR of 16.0% during review period.

Gene sequencing for basic research refers to the process of determining the precise order of nucleotides (A, T, C, G) in a DNA molecule to better understand the genetic makeup of organisms. In basic research, gene sequencing is a powerful tool used to explore fundamental biological questions, such as gene function, evolutionary relationships, and genetic variation within populations. This technology allows researchers to identify specific genes involved in disease, development, and adaptation, which can contribute to the understanding of molecular mechanisms at a cellular and organismal level. Through sequencing, scientists can also discover new genetic markers, regulatory elements, and mutations that play a role in health and disease.
