Glass-like-carbon Coated Graphite is a material whose substrate is graphite, which is made by impregnating or coating glassy carbon. The glassy carbon coating can eliminate the generation of furnace particles, provide sealed surface pores, have excellent demolding properties and reduce permeability, making this material very suitable for continuous casting molds and products in the semiconductor industry. This material has a wide range of applications in the semiconductor industry, especially in graphite parts such as single crystal silicon pulling equipment components, epitaxial growth components, continuous casting molds, glass sealing jigs, etc.

Market Overview

Glass-like-carbon coated graphite is primarily utilized in industries requiring high durability, corrosion resistance, and electrical conductivity. These industries include semiconductors, metallurgy, and others where traditional graphite materials may not suffice due to their susceptibility to wear and corrosion.
