According to our (Global Info Research) latest study, the global Glass Wool and Rock Wool Production Line market size was valued at US\$ 559 million in 2024 and is forecast to a readjusted size of USD 743 million by 2031 with a CAGR of 3.9% during review period.

A glass wool production line is a set of industrial facility that transforms glass raw materials into fiber - like products through processes such as high - temperature melting and fiberization. It starts with raw materials like quartz sand, limestone, and soda ash. These materials are melted in a furnace, and then the molten glass is forced through small holes, forming fine fibers. The fibers are then bonded together using a binder and shaped into various forms such as sheets or rolls. A rock wool production line, on the other hand, uses natural rocks or slag as raw materials. The rocks are melted at high temperatures, and the molten material is spun into fibers. These fibers are then combined with a binder to form products that are widely used in construction and industrial applications.
