## Abstracts

The global 1-Ethyl-3-Methylimidazolium Chloride market size is expected to reach \$ 37.16 million by 2032, rising at a market growth of 3.9% CAGR during the forecast period (2026-2032).

1-Ethyl-3-methylimidazolium chloride ([EMIM]Cl) is a common room-temperature ionic liquid, consisting of an imidazolium ring with ethyl and methyl groups substituted on the nitrogen atoms, and a chloride anion. It is usually a white crystalline solid with low vapor pressure and high thermal stability. It can be used as a reaction solvent (such as in Diels-Alder reactions and cellulose processing) or as a raw material for electrochemical research.

The upstream core raw materials are N-methylimidazole and chloroethane, and auxiliary materials include organic solvents such as acetonitrile and ethyl acetate used for purification. The production process involves high-pressure reactors and precision distillation equipment.

Global sales in 2025 are estimated to be approximately 800 tons, with an average market price of approximately US\$35 per kilogram. The industry's gross profit margin is between 20% and 30%.

With the growing global emphasis on sustainable development and 'zero-emission' production processes, it has demonstrated an irreplaceable role as a substitute for volatile organic compounds (VOCs) in the high-value utilization of biomass and in novel energy storage devices. This has created significant market growth opportunities for these high-performance ionic liquids. However, the industry also faces significant obstacles, with high production process requirements and raw material costs limiting the speed of their large-scale adoption.
