## Abstracts

The global 1,1'-Carbonyldiimidazole (CDI) market size is expected to reach \$ 27.71 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

1,1'-Carbonyldiimidazole (also written as N,N'-carbonyldiimidazole, abbreviated as CDI; CAS 530-62-1, molecular formula  $C_7H_8N_2O$ ) is a versatile reagent used in numerous chemical synthesis processes as a safer equivalent to phosgene. It functions as an efficient coupling and activation agent in the formation of amides, esters, and carbonyl compounds. Due to its stability and reliable performance, it is widely applied in pharmaceutical and industrial production, making it a valuable intermediate in fine and specialty chemical manufacturing.

In 2025, global production of 1,1'-Carbonyldiimidazole (CDI) reached approximately 1,328 tons, with an average global market price of around US\$ 17/kg. The gross profit margin is approximately 20%-30%.

Gradual growth, niche scale: CDI demand typically expands at a moderate pace because it is tied to specific synthesis routes (pharma intermediates, peptides) rather than broad commodity uses.

Often campaign / make-to-order production: Many suppliers prefer to organize production by batch/order rather than large-scale upfront stockpiling.

Substitution competition is real in amide/peptide coupling: CDI competes with alternative coupling strategies and reagents (e.g., T3P, HATU in some settings) and with process designs aiming to reduce coupling-reagent usage.

Development speed varies across regions: Asia-Pacific growth is expected to be faster, led by China and India. In parallel, the market shows increasing China/India-based supply depth, supporting faster regional expansion.

Technology trend: Better yield and waste reduction via imidazole recycle loops. Patented industrial routes emphasize neutralizing the imidazole?HCl by-product and recycling imidazole back into CDI production, targeting cost reduction and more sustainable operations.
