## Abstracts

According to our (Global Info Research) latest study, the global 12 Inch Monocrystalline Silicon Furnace market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

12-inch (300mm) monocrystalline silicon furnace is the equipment used to produce 12-inch silicon wafers. Used to grow high-quality single crystal silicon material, which is then processed into silicon wafers. These silicon wafers are used to make various types of integrated circuits, including microprocessors, memory chips, sensors, power devices, and more.

Single crystal silicon growth is a high temperature process, usually using the Czochralski method or other similar methods. During this process, the silicon material gradually cools from its molten state, forming a continuous single-crystal structure. Through precise temperature and other parameter control, high-quality, low-defect monocrystalline silicon crystals can be obtained. 12-inch silicon wafers have higher manufacturing efficiency than smaller sized silicon wafers. Larger wafer sizes mean more chips can fit on each wafer, reducing the manufacturing cost per chip. This helps meet the growing semiconductor market demands and drives higher performance and more complex chip designs.
