The global 1H,1H,2H,2H-Nonafluorohexyl Acrylate market size is expected to reach \$ 53.10 million by 2032, rising at a market growth of 5.0% CAGR during the forecast period (2026-2032).

1H,1H,2H,2H-Nonafluorohexyl acrylate is a fluorotelomer acrylate (FTAC) monomer with formula $C_8H_7F_9O_2$. It is an acrylic ester carrying a short fluorinated “telomer” side chain, which can impart low surface energy and strong water/oil repellency when incorporated into polymers. Commercial material is commonly supplied with polymerization inhibitors such as TBC (or MEHQ) to prevent premature self-polymerization.

Upstream, n:2 fluorotelomer alcohols (FTOHs) are key raw materials used to produce n:2 fluorotelomer acrylates, typically via acrylation under controlled conditions to form the corresponding acrylate ester. Downstream, the monomer is mainly used as a comonomer to make side-chain fluorinated polymers for surface-protection performance; these materials are widely used in textile and carpet/upholstery treatments to provide oil/water/soil repellency. In environmental and regulatory contexts, fluorotelomer-acrylate polymers can degrade over time and are studied as potential sources of persistent PFAS (e.g., via transformation pathways discussed in the literature).

In 2025, global sales of 1H,1H,2H,2H-Nonafluorohexyl acrylate reached approximately 455 tons, with an average global market price of around US\$ 80/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 20%-40%.
