## Abstracts

The global 2-Ethyl Hexylamine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

One of the significant applications of 2-EHA is as a chemical intermediate in the production of numerous chemicals such as agrochemicals, surfactants, pharmaceuticals, and personal care products. It is primarily used as a building block for the synthesis of herbicides, insecticides, fungicides, and other pesticides. The use of 2-EHA in the production of surfactants is also growing due to its excellent surface-active properties.

The pharmaceutical industry also utilizes 2-EHA in the production of active pharmaceutical ingredients (APIs) and other drugs. It is used as a reaction intermediate in the production of several pharmaceuticals, including antihistamines, local anesthetics, and anti-inflammatory drugs. Additionally, 2-EHA is used in the production of personal care products, such as shampoos, soaps, and detergents, due to its excellent surfactant properties.

Another emerging application of 2-EHA is in the production of water treatment chemicals. It is used as a building block in the production of various water treatment chemicals such as flocculants and coagulants. The demand for water treatment chemicals is increasing due to the growing concerns over the quality of drinking water and the need for effective wastewater treatment.

In conclusion, the market for 2-Ethyl Hexylamine is expected to grow due to the increasing demand for various chemicals in agriculture, pharmaceuticals, personal care products, and water treatment. The growth of the agrochemical industry, along with the

increasing demand for surfactants and APIs, is expected to drive the demand for 2-EHA in the coming years.

2-Ethylhexylamine is a widely used organic synthesis intermediate, and is the main raw material for synthesizing pesticide synergists (the synergist and pesticides are mixed, which can improve the insecticidal effect and reduce Environmental pollution), but also can be used as an intermediate for the synthesis of dyes, pigments, surfactants, pesticides, and raw materials for the production of stabilizers, preservatives, vulcanization accelerators, antioxidants, flotation agents, and emulsifiers. The existing synthetic method has low conversion rate, poor selectivity, complicated process and high production cost.
