Abstracts

According to our (Global Info Research) latest study, the global (2-Ethylhexyl)phosphonic Acid Mono-2-ethylhexyl Ester (P507) market size was valued at US\$ 50.27 million in 2025 and is forecast to a readjusted size of US\$ 78.33 million by 2032 with a CAGR of 6.4% during review period.

P507, commonly known internationally as HEHEHP or PC-88A, is an acidic organophosphorus extractant mainly used in solvent extraction and hydrometallurgical separation. It contains a phosphonic acid functional group and branched 2-ethylhexyl hydrophobic chains, giving it both cation-exchange capability and good solubility in hydrocarbon diluents. In industrial applications, P507 is valued for metal-ion selectivity and phase compatibility, especially in cobalt-nickel separation, rare earth separation, and the recovery of selected non-ferrous and rare metals. TCI describes this product as an acidic organophosphorus extractant for efficient separation and recovery of metals such as palladium, platinum, molybdenum, vanadium, aluminum, cobalt and nickel, while Daihachi highlights cobalt-nickel separation and rare earth applications for PC-88A.

In 2025, global sales of (2-Ethylhexyl)phosphonic Acid Mono-2-ethylhexyl Ester (P507) reached approximately 9,008 tons, with an average global market price of around US\$ 5,424/ton. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 15% to 30%.

P507 is a key functional chemical for hydrometallurgy and rare earth separation. It is not

a typical bulk chemical, but it has high process value in metal separation flowsheets. Its demand is closely linked to rare earth materials, cobalt-nickel hydrometallurgy, non-ferrous metal refining, rare metal recovery and recycling of new-energy battery materials. Because rare earth elements, cobalt-nickel systems and complex leachates often contain metals with similar chemical behavior, downstream users place high value on extraction selectivity, phase separation, stripping efficiency, emulsion control and batch consistency. Therefore, competition in P507 is not driven only by price, but also by process fit and long-term operating stability.

From a market outlook perspective, P507 is expected to maintain a relatively stable demand base. Rare earth permanent magnet materials, high-purity rare earth oxides, battery-grade nickel and cobalt salts, spent battery recycling and complex secondary resource recovery all support the need for selective extractants. In high-purity separation and recycling applications, metal separation efficiency directly affects product purity, recovery yield and overall process cost. Once a customer completes process validation and formulation matching, extractant substitution is usually cautious, which gives qualified suppliers relatively strong customer stickiness.

The market also has clear constraints. P507 performance depends not only on active acid content, but also on impurities, acid value, color, hydrolysis resistance, phase separation behavior and storage and logistics quality control. Customers therefore place high requirements on batch consistency and reliable long-term supply. At the same time, P507 faces competition from P204, Cyanex 272, synergistic extraction systems and newer extractants. Overall, future opportunities will mainly come from high-purity rare earth separation, battery metal recycling, complex leachate treatment and regional supply-chain development, while the key basis of competition will shift further toward product stability, process adaptability and reliable supply capability.
