Abstracts

According to our (Global Info Research) latest study, the global 2-Fluoroaniline market size was valued at US\$ 106 million in 2025 and is forecast to a readjusted size of US\$ 137 million by 2032 with a CAGR of 3.8% during review period.

2-Fluoroaniline, chemical formula C_6H_5FN , molecular weight 111.12, CAS number 348-54-9, is a colorless to light yellow transparent liquid. In terms of solubility, 2-fluoroaniline is insoluble in water, but soluble in ethanol and ether. It is an important organic chemical intermediate and is widely used in many fields such as medicine, pesticides, and dyes.

The upstream production primarily relies on basic chemical raw materials such as o-nitrochlorobenzene or o-nitroaniline, undergoing halogen exchange using fluorinating agents (such as potassium fluoride), or directly using o-fluoronitrobenzene as a precursor.

Global sales in 2025 are projected to be approximately 18,000 tons, with an average market price of around US\$5,719 per ton. The industry's gross profit margin is in the range of 15%-30%.

As a specialized product within the fluorinated aniline series, its core value lies in utilizing the electronic effects and lipophilicity of fluorine atoms to significantly improve the metabolic stability and biological activity of the final products. With the increasing global demand for innovative drugs and low-toxicity, high-efficiency pesticides, the demand for 2-fluoroaniline as a key intermediate is steadily growing.

Due to the highly complex fluorination and hydrogenation reduction reactions involved in

its production process, the global supply landscape for this product exhibits a clear trend towards consolidation. Leading companies with proprietary core fluorination technologies are gradually extending their value chain downstream to secure higher profit margins.
