Abstracts

The global 2-Methylbenzimidazole market size is expected to reach \$ million by 2032, rising at a market growth of %CAGR during the forecast period (2026-2032).

2-Methylbenzimidazole is an organic compound formed by the fusion of a benzene ring and an imidazole ring, with a methyl group attached at the 2-position of the imidazole ring. This substance typically appears as needle-shaped crystals and is widely used in organic synthesis, as a pharmaceutical intermediate, and as a metal corrosion inhibitor. The key upstream raw materials are o-phenylenediamine (OPD) and acetic acid (or acetic anhydride). O-phenylenediamine is the decisive factor in cost, and its price fluctuates significantly due to environmental regulations and limitations in nitration process capacity.

Global sales in 2025 are projected to be approximately 360 tons, with an average market price of approximately US\$25/kg. The industry's gross profit margin is in the range of 15%-30%.

In the pharmaceutical field, the supply chain of intermediate chemicals plays a core role in the synthesis of antibacterial and antifungal drugs. The structural characteristics of 2-methylbenzimidazole make it a key building block in the construction of many active molecules. This demand is driven by the steady growth of global pharmaceutical research and development and production, as well as the requirements for diversity in intermediates due to modern organic synthesis and the optimization of green synthesis routes.

However, there are also some hindering factors in the industry, stemming from fluctuations in raw material prices, compliance constraints, difficulties in optimizing production processes, and uneven demand in the end market.

This report studies the global 2-Methylbenzimidazole production, demand, key manufacturers, and key regions.
