Abstracts

The global 2-(Nonafluorobutyl)ethyl Methacrylate market size is expected to reach \$ 15.79 million by 2032, rising at a market growth of 5.2% CAGR during the forecast period (2026-2032).

2-(Nonafluorobutyl)ethyl methacrylate is a fluorotelomer-based methacrylate monomer. Structurally, it contains a highly fluorinated “tail” (C₄F₉-) linked through a -CH₂CH₂- spacer to a methacrylate group, making it a reactive monomer used to build side-chain fluorinated polymers (SCFPs) with very low surface energy.

Upstream, fluorotelomer-based monomers typically originate from telomerization chemistry using perfluoroalkyl iodides as intermediates, which are further converted to fluorotelomer building blocks and then functionalized into acrylates/methacrylates. Downstream, 2-(Nonafluorobutyl)ethyl methacrylate is polymerized or copolymerized (acrylate/urethane systems, etc.) into SCFPs that are mainly used as surface protectors to impart water-/oil-repellency and soil resistance to textiles and apparel, and to provide oil- and water-resistance in food-contact paper/paperboard.

In 2025, global sales of 2-(Nonafluorobutyl)ethyl methacrylate reached approximately 92 tons, with an average global market price of around US\$ 116/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 20%-50%.
