Abstracts

The global 2-(Perfluorobutyl) Ethyl Iodides market size is expected to reach \$ 89.63 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

2-(Perfluorobutyl)ethyl iodide (CAS 2043-55-2) is a fluorotelomer iodide (FTI). Its structural formula is $C_4F_9CH_2CH_2I$ (molecular formula often written as $C_6H_4F_9I$), featuring a perfluorobutyl “tail” (C_4F_9-) linked via an ethylene spacer ($-CH_2CH_2-$) to an iodide leaving group, making it a reactive fluorinated building block for further functionalization.

Industrially, FTIs are typically produced from perfluoroalkyl iodides (PFAIs, “Telomer A”) made by telomerization of a telogen iodide (often C_2F_5I) with tetrafluoroethylene (TFE), followed by a second-step ethylene insertion to give the general FTI structure $C_nF_{2n+1}CH_2CH_2I$ (the $n=4$ member corresponds to this product). Downstream, the iodide is used as an intermediate to introduce alternative functional “heads” (e.g., alcohols and other derivatives), enabling the manufacture of fluorotelomer-based surfactants and side-chain fluorinated polymers used in surface-protection / water- and oil-repellency applications (textiles, paper, coatings, etc.); as a PFAS-related precursor, compliance and stewardship considerations are often part of commercialization.

In 2025, global sales of 2-(Perfluorobutyl)ethyl iodide reached approximately 381 tons, with an average global market price of around US\$ 171/kg. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 25% to 45%.
