Abstracts

The global 2-(Perfluorobutyl)Ethyl Acrylate market size is expected to reach \$ 36.58 million by 2032, rising at a market growth of 4.1% CAGR during the forecast period (2026-2032).

2-(Perfluorobutyl)ethyl acrylate (CAS 52591-27-2) is a fluorotelomer acrylate (FTAc) monomer: it is an acrylate ester bearing a short poly/perfluoroalkyl “telomer” tail (commonly denoted 4:2, i.e., C₄F₉-CH₂CH₂-) that imparts very low surface energy, chemical resistance, and hydrophobic/oleophobic character when incorporated into polymers or copolymers.

Upstream, this monomer is typically prepared by esterification/acylation of a corresponding fluorotelomer alcohol (FTOH) with acrylic acid or (more commonly for high yield) acryloyl chloride, using inhibitors (e.g., MEHQ/TBC) to suppress premature polymerization. Downstream, it is mainly consumed as a comonomer to make side-chain fluorinated (meth)acrylate polymers for surface property modification; in regulatory science, fluorotelomer acrylates can undergo ester hydrolysis back to fluorotelomer alcohols, followed by further transformation to short-chain PFCAs (mechanism described for fluorotelomer acrylate class).

In 2025, global sales of 2-(perfluorobutyl)ethyl acrylate reached approximately 326 tons, with an average global market price of around US\$ 82/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 20%-40%.
