Abstracts

The global 2-(Perfluorobutyl)ethyl Methacrylate market size is expected to reach \$ 9.99 million by 2032, rising at a market growth of 3.5% CAGR during the forecast period (2026-2032).

2-(Perfluorobutyl)ethyl methacrylate (CAS 1799-84-4) is a fluorinated polymerizable monomer belonging to the fluorotelomer methacrylate family (commonly abbreviated as 4:2 FTMAC).

Upstream, it is typically produced from fluorotelomer building blocks (derived from fluorotelomer chemistry and related intermediates) coupled with a methacrylate functionality, followed by purification and stabilization (inhibitor addition) to control premature polymerization. Downstream, it is mainly used as a comonomer to make side-chain fluorinated (meth)acrylate polymers and related coatings/finishes that impart water- and oil-repellency and soil/stain resistance—notably for textiles/apparel and food-contact paper & paperboard, and in some cases for inks/paints/lacquers/varnishes as fluorinated performance additives (typically via the polymers/formulations derived from such monomers).

In 2025, global sales of 2-(Perfluorobutyl)ethyl methacrylate reached approximately 55 tons, with an average global market price of around US\$ 138/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 25%-45%.
