## Abstracts

The global 2-Phenyl-5-Benzimidazolesulfonic Acid market size is expected to reach \$ 120 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

2-Phenyl-5-benzimidazolesulfonic acid (abbreviated as PBSA; CAS No.: 27503-81-7) is a highly effective, water-soluble UVB absorber. It presents as a white powder with excellent stability and is primarily utilized in daily sun protection skincare products such as lotions and creams as well as in water-based coatings, serving to block ultraviolet radiation that causes skin aging and damage.

The upstream segment of the 2-phenyl-5-benzimidazolesulfonic acid value chain centers primarily on fine organic synthesis raw materials. These include key precursors such as *o*-phenylenediamine and benzoic acid (or benzaldehyde/benzoyl chloride); the final product is obtained by first constructing the benzimidazole ring via a condensation reaction, followed by a sulfonation reaction using concentrated sulfuric acid or chlorosulfonic acid. The supply of these raw materials is significantly influenced by fluctuations in basic chemical prices as well as environmental and safety regulations. Downstream applications are precisely targeted at water-based sun protection systems, including sunscreen sprays, lightweight daily creams, and transparent sunscreen gels.

In 2025, global sales volume is projected to reach approximately 4,200 tons, with an average selling price of \$20 per kilogram. The industry's gross profit margin ranges between 30% and 40%.
