## Abstracts

The global 2,2'-Azobis(2-Methylpropionamide) Dihydrochloride market size is expected to reach \$ 64.75 million by 2032, rising at a market growth of 3.1% CAGR during the forecast period (2026-2032).

2,2'-Azobis(2-amidinopropane) dihydrochloride (abbreviated as AIBA or V-50) is a soluble azo-type free radical initiator commonly used in aqueous solution polymerization. It decomposes to produce free radicals that initiate modular polymerization and is widely used in polymer synthesis, such as amino acid polymerization. It offers good solubility, stable molecular weight, high product purity, and low toxicity. Its upstream supply chain begins with basic chemical raw materials, mainly azobisisobutyronitrile (AIBN), involving methanol, hydrogen chloride, and ammonia. The global total volume is projected to be approximately 1000 tons in 2025, with an average global market price of approximately US\$51,000 per ton. The industry's gross profit margin is in the range of 15%-30%.

2,2'-Azobis(2-methylpropionamide) dihydrochloride is a water-soluble azo initiator primarily used in the polymerization of water-soluble vinyl monomers. It efficiently initiates polymerization at low temperatures and low concentrations, producing highly linear polymers with high molecular weights. Compared to other azo initiators, 2,2'-azobis(2-methylpropionamide) dihydrochloride exhibits high efficiency and stable initiation performance, resulting in products with higher molecular weight, good water solubility, and low residual content. As an important azo initiator, it has broad application prospects in the field of polymer synthesis.
