Abstracts

According to our (Global Info Research) latest study, the global 2,3-Epoxypropyltrimethylammonium Chloride market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

2,3-Epoxypropyltrimethylammonium chloride is a bifunctional, reactive organic compound featuring both quaternary ammonium and epoxy groups; it appears as a white solid under ambient temperature and pressure. As a solid, reactive cationic etherifying agent, it reacts with various substrates such as starch, cellulose, guar gum, and polyacrylamide and finds widespread application in industries including papermaking, consumer chemicals, petroleum, and water treatment.

Key upstream raw materials include epichlorohydrin and trimethylamine (or its aqueous solution); certain production routes also utilize hydrochloric acid, sodium hydroxide, water, solvents, and refining aids. In 2025, global sales volume is approximately 4,500 metric tons, with a global average market price of around US\$4.0 per kilogram; major manufacturers in the industry typically achieve gross profit margins of approximately 25%–35%.

2,3-Epoxypropyltrimethylammonium chloride (CHPTAC) is a highly reactive cationic etherifying agent primarily used to modify natural polymers such as starch, cellulose, and guar gum. The industry's growth is driven by the steady demand for cationic starch in the papermaking, packaging, and recycled paper sectors, as well as the expanding application of modified bio-based polymers in water treatment, personal care, and functional materials. However, its market dynamics are also influenced by factors such

as competition from alternative cationic etherifying agents, profit fluctuations in the downstream papermaking industry, and environmental regulations.
