Gesture recognition is a mathematical calculation of interactions performed by a human being via a computing device. The interactions performed are passed through a number of mathematical algorithms before the computing device interprets it. Gesture recognition involves:

Scope of the Report:

This report studies the 2D Gesture Recognition market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the 2D Gesture Recognition market by product type and applications/end industries.

Gesture recognition enhances efficiency and ease of usage for the underlying logical design of a stored program. Gesture recognition avoids the usage of keyboards and mouse for any action. It can be classified as 2D and 3D gesture recognition technologies. 2D gesture recognition makes use of a camera-enabled device.

In gesture recognition, an invisible infrared light is beamed on the individual standing in front of the camera. This light is then reflected back to the camera, from where it is sent to a gesture recognition IC. The IC, with the aid of gesture recognition software, then creates a depth map of the images received and responds appropriately to the movements in front of the camera. 2D gesture recognition offers a user-friendly environment between a device and an individual. It is a cost-effective gesture recognition technique for interaction.

The global 2D Gesture Recognition market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.

The Asia-Pacific will occupy for more market share in following years, especially in China, also fast growing India and Southeast Asia regions.

North America, especially The United States, will still play an important role which cannot be ignored. Any changes from United States might affect the development trend of 2D Gesture Recognition.
