## Abstracts

According to our (Global Info Research) latest study, the global 3-Methylthiopropanol market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

3-Methylthiopropanol is a small organosulfur thioether-alcohol (molecular formula  $C_3H_7OS$ , CAS 505-10-2). It is a colorless to pale yellow liquid at room temperature. At low concentrations, it has an aroma reminiscent of broth, soy sauce, or pineapple; at high concentrations, it has a sulfurous odor. It is widely used in food flavorings and cosmetic flavorings.

The core upstream raw materials for 3-methylthiopropanol are allyl alcohol and methanethiol, produced through a catalytic addition reaction. Its downstream applications are highly concentrated in the flavor and fragrance industry, specifically as a key aroma component. It is mainly used in the formulation of savory food flavorings (such as meat, seafood, and soup bases), coffee and cocoa flavorings, and high-end cosmetic flavorings, serving as an irreplaceable core ingredient that imparts the characteristic flavors of these products.

In 2025, global sales of 3-methylthiopropanol reached approximately 180 tons, with an average global market price of around US\$ 48/kg. As a niche chemical, its global production capacity is low, and its gross profit margin is approximately 20%-50%.

3-Methylthiopropanol is a classic high-impact sulfur ingredient: it is typically used at trace levels, so demand is driven by formulation needs rather than by bulk consumption. The commercial value is therefore less about sheer tonnage and more about sensory

consistency, impurity control, and regulatory/traceability readiness. In savory profiles it can add cooked-vegetable / onion-like depth and help build realistic “cooked” notes, often serving as a nuance ingredient that lifts overall authenticity.

On the supply side, the market tends to be specification-segmented: different customers set different limits for sulfur-byproducts and aldehyde/acid residues, which can materially change price positioning and available suppliers. Labeling (e.g., natural vs nature-identical) and certifications can further constrain supply and influence lead times. Overall, the outlook is closely tied to innovation cycles in savory flavours, seasonings, and the broader flavour & fragrance industry, where such small molecules remain important tools for targeted flavour construction despite their limited volumes.
