A 3D acoustic camera is a device that integrates acoustic sensor technology, signal processing technology, and imaging technology. It collects sound signals through an array of multiple microphones and employs algorithms such as beamforming and sound source localization to precisely analyze and calculate the propagation of sound in three-dimensional space. Ultimately, it visually presents the spatial distribution and characteristics of sound, enabling users to intuitively observe information such as the location, intensity, direction, and other attributes of sound in three-dimensional space.
