Abstracts

The global 3D Camera for AGV market size is expected to reach \$ 475 million by 2032, rising at a market growth of 7.3% CAGR during the forecast period (2026-2032).

3D Camera for AGV is a device installed on an automatic guided vehicle (AGV) that uses 3D imaging technology (such as structured light, ToF, etc.) to quickly obtain the three-dimensional position information of objects in the environment. It captures 3D data of dynamic or static objects to provide AGV with accurate spatial positioning, obstacle avoidance, path planning and target recognition capabilities. Its core functions include real-time generation of high-quality point cloud data, adaptation to different lighting and material conditions (such as reflective, dark objects), support for multi-view synthesis and three-dimensional modeling, and has the characteristics of high precision, high speed, and resistance to ambient light interference. It is widely used in scenarios such as unmanned forklift pallet recognition, AGV obstacle avoidance, industrial logistics handling, and disordered workpiece grasping, which can significantly improve the automated navigation efficiency and operation accuracy of AGV.
