Abstracts

According to our (Global Info Research) latest study, the global 3D Cardiac Mapping System market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Cardiac mapping is a technique in which the information from cardiac electrograms is gathered and displayed. Cardiac mapping is used to diagnose the heart rhythms especially in case of arrhythmia. The cardiac mapping procedure is usually done by inserting catheter into the heart chamber percutaneously and recording the electrograms sequentially, this is done in order to correlate the electrograms with cardiac anatomy. The new 3D cardiac mapping systems create the three dimensional model of any chamber of heart and can track exact location of the catheter. This allows movement of the catheters without using X-ray. They are designed to improve the resolution and gain prompt cardiac activation maps.

The 3D cardiac mapping system market is anticipated to grow with a significant CAGR owing to the increase in number of patients with arrhythmia and other cardiac disorders, rising pressure to reduce diagnosis errors and increasing healthcare expenditure. The major factors driving the growth of 3D cardiac mapping systems is the precision and patient safety enabled by real-time monitoring. The increase in aging population who are more prone to chronic heart disorders will elevate the demand for the 3D cardiac mapping system. The increase in prevalence and diagnosis rate of cardiac illness is the major factors which is creating the demand for 3D cardiac mapping systems. The 3D cardiac mapping also help in reducing the time of diagnosis. The restraining factors for the 3D cardiac mapping system market are high cost of services and limited adoption rate of the systems.
