According to our (Global Info Research) latest study, the global 3D Centrifugal Grinder market size was valued at US\$ 238 million in 2024 and is forecast to a readjusted size of USD 333 million by 2031 with a CAGR of 4.9% during review period.

The three-dimensional centrifugal grinder is an experimental instrument that integrates the three functions of freezing, grinding, and centrifugation. This equipment uses the principles of high-frequency oscillation and centrifugal motion to quickly and efficiently break, homogenize, and break cell walls of various samples, thereby releasing the original biological macromolecules such as DNA, RNA, and proteins, which are convenient for subsequent extraction and purification. The three-dimensional centrifugal grinder is widely used in biology, medicine, agronomy, environmental science and other fields. It can be used to process samples from various sources, including soil, plant and animal tissues/organs, bacteria, yeast, fungi, spores, paleontological specimens, etc. The samples processed by this instrument can be used for subsequent experiments such as DNA/RNA extraction, protein purification, and enzyme activity determination.
