## Abstracts

According to our (Global Info Research) latest study, the global 3D Cryo-grinder market size was valued at US\$ 365 million in 2024 and is forecast to a readjusted size of USD 508 million by 2031 with a CAGR of 4.8% during review period.

The three-dimensional cryo-grinder is a high-throughput rapid processing equipment commonly used in laboratories, mainly used for grinding, crushing and homogenizing samples. The three-dimensional cryo-grinder adopts a special three-dimensional integrated operation mode, which allows the sample to move three-dimensionally in space (such as the shape of '?'), and through the vibration of media such as tungsten carbide balls and stainless steel balls in the sample tube, the sample can be crushed, mixed, homogenized and the cells can be broken. The equipment can maintain an extremely low temperature (such as -40°C) during the grinding process, effectively preventing the degradation of the target substance and retaining its activity. It is suitable for grinding sensitive substances such as nucleic acids and proteins. The three-dimensional cryo-grinder can be used for grinding and crushing various samples such as various animal and plant tissues, soil, fungi, cells, paleontological specimens, hair, etc.
