## Abstracts

According to our (Global Info Research) latest study, the global 3D Dynamic Focusing Fiber Laser Marking Machine market size was valued at US\$ 879 million in 2024 and is forecast to a readjusted size of USD 1198 million by 2031 with a CAGR of 4.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

The 3D dynamic focusing fiber laser marking machine is a three-dimensional surface processing equipment based on fiber laser and high-precision dynamic focusing technology. Its core principle is to achieve real-time positioning and dynamic adjustment of the focal length of the laser spot in three-dimensional space through the coordinated control of the galvanometer system and the dynamic focusing lens group. Specifically, the equipment uses a fiber laser as a light source (usually with a wavelength of 1064nm), and uses an F-? lens to project the laser beam to the two-dimensional galvanometer scanning field. At the same time, a dynamic focusing mirror (such as a variable focal length liquid lens or an electric focusing module) is used to compensate for the difference in focal depth of different processing planes, thereby forming a high-energy density spot that is always clear on the surface of curved surfaces, inclined surfaces or complex three-dimensional workpieces. This technology breaks through the plane processing limitations of traditional 2D marking machines and can automatically adapt to changes in product surface height (Z-axis dynamic range is usually  $\pm 50\text{mm}$ ). While maintaining marking accuracy ( $\pm 0.01\text{mm}$ ), it can achieve three-dimensional effects such as deep carving, three-dimensional relief, and curved surface engraving. It

is widely used in precision processing scenarios in industries such as consumer electronics, automotive parts, and medical devices.
