## Abstracts

The global 3D Laser Profile Measuring Instrument market size is expected to reach \$ 481.7 million by 2029, rising at a market growth of 14.5% CAGR during the forecast period (2023-2029).

3D Laser Profile Measuring Instruments, also known as external profile sensors. The laser triangulation principle is used to collect two-dimensional contour information on different material surfaces. The laser beam is amplified by a special lens set to form a static laser line that is projected onto the surface of the measured object. The laser line is diffusely reflected on the surface and the reflected light is projected onto the sensitive sensor matrix through a high-quality optical system. In addition to the distance information from the sensor to the measured surface (Z-axis), the controller can also calculate the position information along the laser line (X-axis) from the image information. The profilometer measurement outputs a set of two-dimensional coordinate values in a two-dimensional co-ordinate system with the sensor as the centre of origin. By moving the object to be measured or the profiler probe, a set of 3D measurements can be obtained.
