According to our (Global Info Research) latest study, the global 3D Lithography and 3D Microprinting market size was valued at US\$ 136 million in 2025 and is forecast to a readjusted size of US\$ 205 million by 2032 with a CAGR of 6.2% during review period.

Two-Photon Polymerization (TPP) is a maskless direct laser writing technology. With TPP, the light-matter interaction only takes place within the volume of a focused laser spot. The simultaneous absorption of two photons in the focused spot triggers the locally confined polymerization of an exposed photosensitive material. This laser focus can be moved throughout the volume of the photoresist in all three dimensions, allowing for complex 3D structures to be written along the laser's trajectory.

3D lithography and 3D microprinting technologies have experienced rapid growth in recent years, presenting a steadily expanding market. The sector demonstrates a growing market size and increasing sales, with widespread applications in areas such as micro-nano fabrication, biomedical device manufacturing, and photonics devices. As technology continues to advance, these two technologies are poised for significant future development, fostering the emergence of innovative applications and unlocking new possibilities for the manufacturing and research sectors.
